TITLE:

The Deflection of the Steam-Turbine Shaft

(Frogib vala parovoy turbiny)

PERIODICAL:

Energetik, 1958, Nr 2, p 27-29 (USSR)

ABSTRACT:

The turbine described is an AEG active,

condensation, 2-cylinder turbine having 47,000 kW capacity, 1,500 r.p.m., working at 35 atm and

435°C. After 3 months of running, a 0.6 mm deflection of the high-pressure rotor shaft, as well as other irregularities, was noticed. Shaft deflection was also detected in another AEG turbine having 50,000 kW capacity and working at 29 atm and 400°C. Several factors are assumed to be the cause of the trouble (short circuit in the generator circuitry; imperfect screwing of the bearing stop-bolts;

Card 1/2

SOV/91-58-2-20/31

The Deflection of the Steam-Turbine Shaft

insufficient steam supply at the sealings), but the essential cause seems to be the fact that the set of regulation valves is placed only on one side of the turbine and that the cylinder is not firmly enough fastened with key bolts. The author recommends reconstructing the end labyrinth sealings of the turbines cylinders, especially of the front cylinder.

TITLE: Some data on the structural organization of microglia

SOURCE: AN Gruzssr. Institut fiziologii, Trudy, v. 14, 1965. Sovremennyye problemy devatel nosti i stroyeniya tsentral noy nervnoy sistemy (Present problems of the activity and structure of the central nervous system), 181-198

TOPIC TAGS: CNS histology, microglia, glial cell, microgliocyte, sympathetic nervous system, central nervous system

ABSTRACT: A special histological study was made of brain and spinal cord tissue from macacus rhesus monkeys and cats, which were also compared anatomically with the brain and spinal cord of guinea pigs and man. The results confirm existing notions of the structure of neuroglia, and supply new data on the organization and architectonics of microglia. Microglia were found to be the most highly developed in the cerebral cortex, cerebellum, and corpora quadrigemina. The structure of microgliocytes in the spinal cord and subcortical ganglia is less complex. Microglia tend to concentrate in areas where the capillary net is best

Card 1/2

L 22208-66

ACC NR: AT5024237

developed (3d, 4th, and 5th layers of the cerebral cortex). Microgliocytes are evenly distributed in the cortical and subcortical gauglia. Each microgliocyte has branches connecting it independently with individual neurons and other glial cells, and with the capillary net. The microgliocytes of vegetative nuclei (the hypothalamus, lateral sympathetic nucleus, Edinger-Westphal nucleus, etc.) are different from those located in other parts of the brain. Vegetative nucleus microglia are small, simple in structure, and densely concentrated. These microglie are often directly contiguous to neurons and blood vessels. The method used to detect microglia suggests that their nucleic acids are more resistant to denaturation than those of neurons. [PG]

Title

: Standardization of the thermodynamic properties of water and steam.

Periodical: Teploenergetika, 7, 3-6, Jl 1956

Abstract

: A method is presented which was developed by the Moscow Institute of Power Engineering (MEI) for use in compiling tables on the thermodyanmic properties of water and steam. The tables used now in the USSR are unsatisfactory because they describe the pressures and temperatures of water and steam not higher than 300 atmospheres and 700°C. The new preliminary MEI tables present the temperature range from 450 to 1000°C and the pressure range from 100 to 650 atmospheres. These tables are based on the extensive and precise experimental data on caloric values obtained recently in the MEI and VTI (All-Union Heat Engineering

AID P - 4798

Teploenergetika, 7, 3-6, Jl 1956

Pub. 110-a - 1/17 Card 2/2

> Institute), as well as on the theory of imperfect gases, particularly of steam. After the All-Union Conference on these problems (proposed for 1957) standard State tables will be compiled and published covering the temperatures of water and steam up to 1000°C, and of pressures up to 650 atm. Equations of state, thermo-dynamic functions and tables of reference points for water and super-heated steem up to 1000 atms and 1000 C. (Uravneniye sostoyaniya, TITLE:

termodinamicheskiye funktsii i tablitsy opornykh tochek dlya vody i peregretogo vodyanogo para do 1000 ata i 1000°C).

PERIODICAL: Teploenergetika, 1958, . . . No.4, pp. 46-52 (USSR).

ABSTRACT: In an earlier work the authors proposed an equation of state to facilitate the preparation of steam tables. The earlier article gave results of preliminary calculations of thermal and calorific magnitudes derived from the equation of state over the pressure range of 100 - 650 atmospheres and the temperature range of 450 - 1000°C. Work done since the publication of that article made it possible to considerably extend the range of applicability of the equation of state and to make it somewhat more simple and accurate. At present the equation gives satisfactory agreement with experiment up to a pressure of 1000 atmospheres. The equation is then given.

Card 1/4 It is comparatively simple and can be used to calculate

96-4-0/24 Equations of state, thermo-dynamic functions and tables of reference points for water and super-heated steam up to 1000 atms and 1000°C.

tables of the thermo-dynamic properties of water and steam, also to construct i - s, and T - s diagrams. The physical concept of interaction between molecules, which is the basis of the equation, and the very accurate experimental data used to determine the constants that enter into the equation, make it reliable To check it against for purposes of extrapolation. experimental results, calculations were made at pressures up to 1000 atmospheres in the temperature range 400-650°C, where reliable experimental data already exist. The results of the comparison are given in Table 1. As will be seen, up to a temperature of 500°C, the difference between calculated and measured values does not exceed 0.3%, and the average difference is about 0.12%. In the sub-critical range below 400°C the differences are greater, and reach 2%. This is also to be expected clong the saturation curve. The comparison shows that agreement between calculated and experimental values is satisfactory at temperatures above 420°C, since the differences are within the limits of experimental error.

Card 2/4 By employing the equation of state for steam, and the

96-4-8/24 Equations of state, thermo-dynamic functions and tables of reference points for water and super-heated steam up to 1000 atus and 1000°C.

differential equations of thermo-dynamics, the authors obtained analytical expressions for thermo-dynamic functions and made calculations to check the formulae derived. The equation of state is first used to derive an empression for the enthalpy. This is compared with experimental data in Table 2, with satisfactory agreement. Imressions are then derived for the entropy and internal energy. The authors, using the equation of state and the emisting Moscow Power Institute Tables of the thermodynamic properties of water and steam at pressures up to 300 atmospheres and temperatures up to 700°C, drew up tables of reference values of specific volumes, enthalpy and entropy for the pressure range 1 - 1000 atmospheres and the temperature range 0 - 1000°C. The results of the work are entered in Table 3; values are given every 50°C. Analysis of the reference values shows that they are suitable for the formulation of detailed tables within the stated range of pressure and temperature. Moreover, the table of reference-points is itself useful for a Card 3/4 number of thermal calculations and for the construction

Equations of state, thermo-dynamic functions and tables of reference points for water and super-heated steal up to 1000 atms and 1000°C.

TITLE: Tables of the Thermal-physical Properties of Ammonia

PERIODICAL: Teploenergetika, 1960, Nr 1, pp 63-69 (USSR)

ABSTRACT: Extensive use is now being made of ammonia as a heattransfer medium, but adequate tables of its thermal
physical properties are not available. Accordingly,
the authors decided to study, analyse and select the
most reliable experimental and calculated data on the
properties of ammonia and to work out the tables given
in this article. The tables of pressure, volume and
temperature cover the range of 40 - 290°C; those of
specific heat at constant pressure are for the range
40 - 280°C; and the viscosity tables cover from
30 - 250°C. The pressure range is 1 - 800 kg/cm² in
all cases. International published work on the properties
of ammonia is critically reviewed and the best is used
in formulation of the tables. Table 1 gives values of
the specific volume of ammonia for temperatures up to

Card 1/2 290°C; available values for higher temperatures were not

67645 SOV/96-60-1-14/22

Tables of the Thermal-physical Properties of Ammonia

used because there is evidence of decomposition of ammonia above 290°C. The values tabulated were obtained by calculation and graphical methods. There is satisfactory agreement with other authors and differences do not exceed 0.2 - 0.3%, Work done on the specific heat at constant pressure is reviewed. Values were calculated or determined graphically and the results are plotted in Fig 2. It was considered that the errors in this table may be 2 - 3%, and on the 150° C isotherm at pressures of $100 - 150 \text{ kg/cm}^2$ they may be somewhat greater. The properties of ammonia on the saturation line have been studied by several authors but the data remain inadequate; the thermo-dynamic properties of ammonia on the saturation line from temperatures of - 70 to + 132.4°C are given in Table 3. Work on the viscosity of ammonia is reviewed and values are given in Table 4. It is considered that the values in this table are accurate and reliable up to 250°C and 800 kg/cm². There are 1 figure, 4 tables and 13 references, 4 of which are Soviet, 8 English and 1

Abstract

: The changes of gas and energy metabolism in mountain and submontane regions during the various stages of lactation and at different seasons of the year and times of the day were investigated and described in cows of the aboriginal mountain cattle; also, the changes of the blood's characteristics, of respiration and pulse rate which take place at the submontane part of Severo-Osetinskaya ASSR (North-Osetia Socialist Republic). It was observed that the body temperature and the Hb percentage did not show essential differences

ABSTRACT

The present paper investigates the (n,c) reactions on cadmium, in which palladium isotopes are created. Parallel hereto the cross section of the production of Pd¹⁰⁹ from silver was determined by means of a (n,p)-reaction. Because of the many stable cadmium isotopes the products created on the occasion of the reactions could be identified only by means of the radiochemical method.

Realization of the reactions Cd(n,a)Pd and identification of the products of the reactions: Metallic cadmium or its salts were irradiated with ~ 14 MeV (d,d) -newtrons, 14 MeV (t,d) -newtrons and fission newtrons. The radioactive palladium was precipitated from the targets by a precipitation of dimethyl glyoxime in an acid medium. The activity of the thus obtained radiochemical pure samples was measured by means of a GEIGHR counter, or these samples were dissolved. From this solution, silver (AgCl) was segregated within fixed time intervals for the purpose of identifying the palladium isotope on the basis of the daughter products. On the occasion of irradiation with 14 MeV neutrons no radioactivity was observed in the palladium fraction. In the case of irradiation with fission neutrons an activity of the palladium with T = 14 hours was observed. In the case of irradiation with

The (n,a) Reactions of 11, WeV Neutrons With Cadmium. PA - 3136 1h MeV neutrons radioactive components with halfvalue periods (22+1) minutes, $(5,5\pm0,2)$ hours and $(14,0\pm0,5)$ hours were found to exist in the palladium fraction 3. The ratio of the initial activities of these componexts amounts to (26,4 + 0,8):(0,41 + 0,04) 8 1.0. A table apows the results of the graphical analysis of the decay curves of the cadmium samples which were separated by the different cadmium targets. These regults are then discussed in detail.

Keasuring of the cross sections of the reactions $Cd^{115}(n,a)Pd^{109}$, $Cd^{114}(n,a)Pd^{111}$, $Cd^{116}(n,a)Pd^{1118}$ and $Ag^{109}(n,p)Pd^{109}$ as well as of the reactions with the Key resutrons. All necessary activities were measured by means of a GEIGER counter at equal geometrical conditions. The cross sections thus computed and the standard deviations are shown together in a table, (4 ill. and 5 tables)

The Isomer Pd

PERIODICAL:

(Izomer Pd 1114. Russian).

Doklady Akademii Namk SSSR, 1957, Vol 113, Nr 4, pp 773 - 776

(U.S.S.R.)

ABSTRACT:

First of all the authors give some information on relevant preliminary papers. It is the aim of the paper under review to demonstrate unambiguously that the 5.5-hours palladium activity belenge to a certain isotope or isomer of the palladium. For this purpose, experiments were carried out with regard to the radiochemical separation of isomers in the mixture of the radioactive isotopes of palladium which are produced at the reactions $Cd(n,\alpha)$ and $Pd(n,\chi)$. The method of the chemical separation of the nuclear isomers is based on the Szilard-Chalmers phenomenon. When working on the methods for the separation of the palladium isomers, the authors of the paper under review tried reagents: dimethyl glyoxime, acetoxime, salicylic aldexime and α -nitrose- β -naphtol. The best results were obtained with salicylic aldoxime. Salicylic aldoxime is suited

for the separation of the nuclear isomers of palladium.

The Separation of the Isemers Pd 111* and Pd 111 Produced at the Re-

action Cd 114(n.a) Pd 111.

Card 1/3

The Isemer Pd111a.

During a period of 4 hours, 400 g of cadmium nitrate were exposed to radiation of a current of neutrons of 14 MeV ($\sim 10^7$ neutrons/cm²/sec.). The experimental arrangements are discussed. In the mixture of the radioactive palladium isotopes produced a t the reactions $Cd(n,\alpha)$ Pd there is contained the isomer Pd which is genetically connected with Pd (T=22 min.).

The Identification of the Pd^{111*} (T-5.5 hours) in the Mixture of the Radicactive Palladium Isotopes which were produced at the reactions Pd(n, γ): The corresponding experiment, described in the paper under review proved the production of Pd^{11*} with T=5.5 hours after the reaction Pd(n, γ) and also its genetic composition as Pd¹ (T=22 min) and Ag¹ (T=7.5 days). For the coefficient of the internal conversion the value α=a/b>0.185 was pb-tained. Taking into consideration the given decay scheme Pd¹¹¹ we have α>0.185:0.75 = 0.25.

The determination of the relative yield of the Pd¹¹¹ and of the Pd^{111*} at the reaction (n, *): done by a study of the relevant kinetics of the accumulation of the radioactive silver in the samples of the palladium exposed to radiation (4 reproductions, 3 charts).

Sbornik izobreteniy; plastmassy i sintetichekiye smoly. no. 2. Kom. po delam izobr. i otkrytiy. Moscow, TsBTI, 1962, 33 [Author's certificate no. 129015, Cl. 39b, 2201 (appl. no. 635486 of August 1, 1959)]

TEXT: The treatment of polymer surfaces to be crosslinked with solutions of boron or lithium compounds, e.g., in methyl alcohol; is suggested prior to neutron irradiation. The surfaces to be crosslinked are treated with these solutions, tightly pressed onto each other, tied up with caprone threads, and exposed to neutron irradiation. The following systems can be crosslinked, for example: Teflon-polystyrene, Teflon-organic glass, polyethylene-polystyrene, polyethylene-organic glass, polystyrene-organic glass. The suggestion increases the crosslinking efficiency, since, even with dilute solutions of boron or lithium compounds absorbing, on the whole, 1% of the slow neutrons, the surface lay-

TITLE: Radiolytical Oxidation of Fat

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1959, Vol 2, Nr 4, pp 533 - 540 (USSR)

The investigation of the kinetics and processes of fat oxida-ABSTRACT: tion is necessary for an economical production technology of edible and technical fats and cils as well as for the investigation of the assimilation mechanism of the fats consumed by living organisms. The oxidation reaction of fats forms a chain reaction with degenerate ramifications (Semenov, N. N., Academician, Ref 1). It has been pointed out recently (Tarusov, B. N., Refs 2,3) that the oxidation processes proceeding in the lipoprotein phase of the cell structures play an important role in radiation damage of the organism. The initiation of oxidative chain reactions can be achieved by a short effect of catalysts (initiators) at the beginning of the reaction (Refs 4,5). This phenomenon has many analogies in the developmental dynamics of radiation damages (Ref 6). Purified fresh cod-liver oil was Card 1/3

Radiolytical Oxidation of Fat

SOV/153-2-4-12/32

chosen for the investigation. It was oxidized by means of atmospheric oxygen at 20-130° in a glass cell (Ref 7). It was irradiated with gamma rays from Co60 X-rays, and beta particless from P²² and Au¹⁹⁸. Figure 1 shows typical kinetic curves of the peroxide aggregation with thermal oxidation at 65-100°. They are characterized by an induction period which is shortened with increasing temperature: 8 hours at 65°; the period is almost entirely missing at about 100°. The curves of acid aggregation seen in figure 2 are analogous to the above curves. Acid formation, however, is somewhat retarded since acids are secondary oxidation products (Ref 9). The effect of ionizing radiations on fat containing dissolved oxygen leads to the appearance of oxidation products already at room temperature. The intensities of oxidation in the range of doses used, however, are not high (D=. 103-105p). The extent of the effect depends on the temperature at which the fat is irradiated. The yield rises with increasing temperature (Figs 3,4). This seems to be connected with the attaining of conditions favoring the chain extension (Fig 3). The authors introduce the symbol G for the value of the radiation effect. Equations are derived for G as well as for the reaction rate W. Curve 1 (Fig 5) concerning the oxidation

Card 2/3

Radiolytical Oxidation of Fat

507/153-2-4-12/32

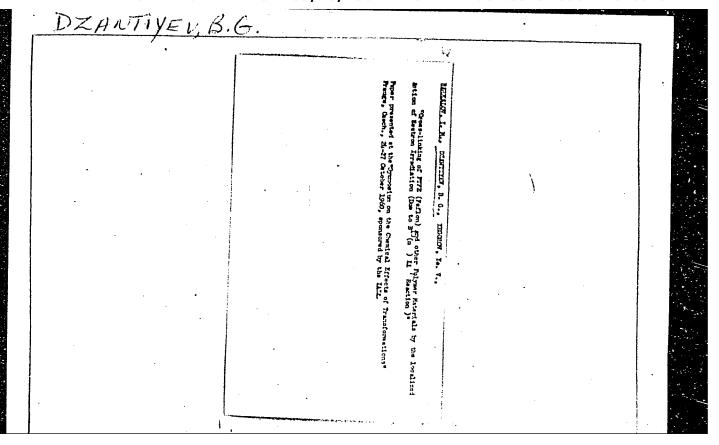

of irradiated and nonirradiated fat at 100° illustrates the presence of an "upper temperature limit". Above this limit the irradiation dose does no longer affect the oxidation kinetics. The effect of a previous irradiation at 200 on the formation kinetics of peroxides in fat with an oxidation at a higher temperature is analogous (Fig 6). Thus, the separation of the irradiation period and the oxidation period with respect to time only affects the duration of the induction period whereas the chemism of the process remains unchanged. The types of radiation mentioned at the beginning neither influence the kinetics nor the chemism of fat oxidation. The quantity of radiation yield depends on the temperature extreme. There are 8 figures and 11 references, 8 of which are Soviet.

Radiation Polymerization of Phenyl Acetylene

PERIODICAL:

Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 7,

pp. 1103-1107

TEXT: Purpose of this paper was the investigation of kinetics and the mechanism of the radiation polymerization of phenyl acetylene which was initiated by electrons with an energy of 1.5 Mev. The irradiation was carried out in special cuvettes (Fig. 1 a). The electron beam was introduced through a plane-parallel glass window 0.5 mm thick. For accurate thermostating within the range of positive temperatures, a different type of cuvette was used (Fig. 1,b). The temperatures of the polymerization were -196 to +85°C. The reaction yield was not higher than 10 - 12%, since in all experiments the initial stage of polymerization was investigated. The radiation dose was determined by a chemical dosimeter (0.02 mole/1 of

Card 1/4

Radiation Polymerization of Phenyl Acetylene

S/190/60/002/007/015/017 B020/B052

 ${\tt CuSO}_4$, 0.002 mole/1 of ${\tt FeSO}_4$, and 0.02 n of ${\tt H}_2{\tt SO}_4$) which was recommended by the Institut in. L. Ya. Karpova (Institute imeni L. Ya. Karpov). The developing Fe^{3+} was photometrically examined by a CP-4 (SF-4) spectrophotometer. The IR spectra of polyphenyl acetylene were studied by Yu. Sh. Moshkovskiy. The polyphenyl acetylene yield rises proportionally to the dose of wide ranges (107 - 108 roentgen) (Fig. 2). Even with the largest doses applied, no noticeable destruction of the developed polymer was observed. This seems to prove the absence of effective inhibitor additions whose presence would be indicated by the S-shape of the curve. In the presence of atmospheric oxygen, the polymer yield is increased to the 1.5to 2-fold under otherwise equal conditions. With a certain dose, the polymer yield does not depend on its quantity, not even at temperatures near the melting point or when the liquid monomer is exposed to radiation. The dependence of the polymer yield on the quantity of the dose was also investigated (Fig. 2) at 0 and -78°C. The extremely low dependence of the polymerization rate of phenyl acetylene on the temperature is also typical. Experiments were carried out regarding the polymerization of phenyl acetylene in nonane and ethyl acetate. In these two solvents the Card 2/4

Radiation Polymerization of Phenyl Acetylene

S/190/60/002/007/015/017 B020/B052

polymer yield differed widely from that expected on the basis of the additivity law (Fig. 3). A very effective radiation energy transfer (the radiation is absorbed by the solvent molecules) to the phenyl acetylene molecules is observed. Substances with structures of the polyacetylene type have the same properties as aromatic hydrocarbons, namely that of taking up the energy of ionizing radiation. The laws of phenyl acetylene polymerization in many respects are specific, sometimes even the opposite of those of the usual radical polymerization. Summing up one may say that the polyphenyl acetylene yield is approximately 8 - 9 molecules when the radiation is 100 ev. In the liquid phase, polymerization and initiation rates are proportional. The activation energy is as low as approximately 700 kcal/mole. A mechanism was suggested which explains the unusual results by the specific properties of highly conjugated products during the polymerization of phenyl acetylene. In these products a strong delocalization of unpaired elements takes place, and the reactivity of similar molecules is reduced with an increase in their length. There are 3 figures and 6 references: 4 Soviet and 2 US.

roentgen dose applied to the surface, at constant B_2O_3 concentration, was investigated and the results are shown in a figure. The tear resistance of the Teflon - polystyrene weld is $120~\rm kg/cm^2$. The mechanism involved in welding polymeric materials by localized neutron irradiation is discussed. The thermal effect is assumed to be the main factor in this type of welding. Triple layer welding of polyethylene and Teflon and other polymeric and non-polymeric materials can be effected by applying interleaves of lithium— and boron-containing polystyrene films. TITLE:

The Thermal and Radiolytic Oxidation of Methyl Oleate

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1960, Vol. 3, No. 2,

pp. 265-271

TEXT: The authors studied the kinetics of the accumulation of products of the thermal and radiolytic oxidation of the methyl cleate by atmospheric oxygen at 50 - 120°. For this purpose a vessel was used which was analogous to that described in Ref. 10. The peroxide amount was determined iodometrically. The acids were determined by titration of the oxidate dissolved in neutral ethanol with an 0.05 N-solution of alcohol-alkali solution. An x-ray apparatus of type RUP 1-M-2, 200 kW was used as radiation source. Air was blown through at a rate of 5 - 7 1/h. The authors proved that the principal amount of the oxidation products is formed by conversion of the hydroperoxides (Refs. 1-4).

Card 1/3

80551

The Thermal and Radiolytic Oxidation of Methyl Oleate

8/153/60/003/02/09/034 B011/B003

A large amount of oxides was also found, however. The authors assume that in addition to peroxides, oxides represent primary oxidation products of the methyl oleate. Furthermore, the authors studied the decomposition kinetics of the organic peroxides in dependence on the oxidation time of the methyl oleate (Fig. 3). They determined that peroxides decompose after the reaction of second order. The constant of the decomposition rate decreases with the intensity of oxidation (Fig. 3). The authors pointed out that a short radiation effect on the oxidation process is mainly expressed by the reduction of the induction period of the peroxide-, acid-, and oxide formation. The reduction in the induction period is proportional to the radiation dose (Fig. 5) in the case of peroxides, but is independent of the radiation dose in the case of oxides. Finally, the authors proved that the amount of peroxide yield subject to radiation is largely dependent on temperature (Fig. 7). The elimination of the radiation source strongly effects the kinetics of the accumulation of peroxides at comparatively low temperatures. Above 80° this influence cannot be observed (Fig. 6). The authors thank Professor N. A. Bakh, and

TITLE:

The effect of gamma radiation on the oxidation of methyl oleate in the presence of inhibitors of free radical processes

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy SSSR. Khimiya i khimicheskaya tekhnologiya, v.4, no.5, 1961,

TEXT: In previous work on the radiological oxidation of natural fats (Ref.1: Izv. vUZ SSSR. Khimiya i khim, tekhnologiya, v.2, 533 (1959)), the present authors had related a reduced induction period with destruction of inhibitors by radiation. the complexity of natural fats, in which the quantity and structure of antioxidants is unknown, the authors decided to study methyl oleate - inhibitor systems. Diphenylamine and hydroquinone, both known as inhibitors of free radical reactions, were employed. The authors had previously (Ref.2: Izv. VUS SSSR. Khimiya i khim. tekhnologiya, v.3, 265 (1960)) studied the effect of radiation on inhibitor free methyl oleate, and considered that radiation leading

31744 \$/153/61/004/005/001/005 £134/£485

The effect of gamma radiation ...

to free radical formation would destroy the inhibitors by reaction with free radicals. Samples were exposed to gamma radiation from Cobalt 60 in apparatus FVT-400 (GUT-400) and the destruction of the inhibitor was followed spectrophotometrically. Irradiation took place at 20°C. Oxidation experiments on irradiated and non-irradiated methyl cleate were carried out at 80°C with continuous passage of air. Experiments with inhibitor free methyl oleate were carried out simultaneously under identical conditions to obtain the rate of free radical formation. Experimental details and methods of analysis were as described in Curves showing the rate of free radical formation in inhibited and non-inhibited methyl oleats were found to be parallel and differed only in their induction period. induction period consists of the basic induction period for the oxidation of inhibitor free methyl oleate and an additional industion period related to the concentration of inhibitor; the latter is practically completely destroyed before free peroxide radicals are The additional induction period is directly proportional to inhibitor concentration, which is characteristic of inhibitors reacting with radicals. Induction periods for Card 2/4

31744 S/153/61/004/005/001/005 E134/E485

The effect of gamma radiation ... irradiated material were lower than for non-irradiated material due to inhibitor destruction, and the decrease in induction period was found to be proportional to the quantity of radiation. Curves showing the relation between inhibitor concentration and induction period, and the decrease in induction period of inhibited methyl oleate with total quantity of radiation, are given as well as correlating equations. It has been shown that quantity of radiation is controlling, and that intensity has virtually no effect. At the low temperature of radiation, the induction period of non-inhibited methyl oleate was practically unaffected by radiation. The correlation between the induction period of inhibited methyl oleate and the quantity of radiation made it possible to calculate the number of radicals formed per unit of radiation. Experiments, carried out in the presence and absence of oxygen respectively, lead to the suggestion that removal of a hydroquinone type inhibitor takes place essentially by reaction with an RO2 type radical. 1 table and 3 Soviet-bloc references. TITLE: Radiation polymerization of acetylenic hydrocarbons

Trudy II Vsesoyuznogo soveshchaniya po radiatsionnoy khi-SOURCE: mii. Ed. by L. S. Polak. Moscow, Izd-vo AN SSSR, 1962,

TEXT: The reaction kinetics and the mechanism of polymerization of phenylacetylene, hexene and cyclohexylacetylene were studied, in both bulk and dissolved monomers, between +80 and -1960C, initiating the polymerization by 1.5 Nev electrons. For bulk polymerization, the yields increased proportionally to the dose of radiation, indicating the absence of inhibitors. Atmospheric oxygen increased the yield of the phenylacetylene polymer, but not those of hexene and cyclohexylacetylene, owing to the absence of the phenyl group in the latter 2 compounds. The rate of polymerization velocity (V) is directly proportional to the radiation intensity (I) and not to Card 1/2

Radiation polymerization of ...

\$/844/62/000/000/077/129 D423/D307

VI as is typical for vinyl monomers. Chain rupture is of a linear nature and is the most important feature of these reactions. The temperature dependence of V was relatively slight for all 3 monomers. Solutions in nonane and ethylacetate were also studied over a wide range of concentration; in all 3 monomers the yields of polymers differed sharply from those expected. A theory for this difference is proposed, substituting the clearly defined process of chain rupture by a single process of chain 'extinction' or 'damping', for which mathematical formulas are presented. This theory accounts for the low activation energy of radiation-induced polymerization of acetylenic hydrocarbons, and also explains the absence of any inhibiting action by oxygen. Hention is also made of the possibility of initiating the polymerization by peroxides. There are 3 figures and 1 table.

TITLE: Investigation of rubber structurization under the action

of accelerated electrons

Trudy II Vsesoyuznogo soveshchaniya po radiatsionnoy khi-SOURCE: mii. Ed. by L. S. Polak. Moscow, Izd-vo AN SSSR, 1962,

569-575

TEXT: Natural butadiene-styrene and carboxylate rubbers were investigated. The energy of the electrons was 0.6, 1.6 and 2 Nev. The specimens were 0.02-0.3 mm thick films, $60 \times 60 \times 1$ mm plates and 10 mm thick washers. Irradiation in free state in air from an accelerator (0.2 - 0.8 megarad/sec) showed less destruction than

that from a Co 60 source in inert atmosphere. In natural rubber, destruction is much greater in the first case. In filled natural rubber it is less in the first case, in pre-vulcanized mixtures of

carboxylate rubber it is equal in both cases. Thermomechanical stability of electron-irradiated vulcanized rubbers was about 4 times as high as that of Co⁶⁰ irradiated rubbers. Those of carboxyl containing rubbers show high strength and wear resistance (abrasion index = 115 cm³/kWh for nonfilled rubbers irradiated with 24 megarad and 200 cm³/kWh for nonfilled sulphur rubbers). Chemical relaxation curve of these rubbers shows destruction and re-grouping of salt bonds in its initial part. There are 6 figures and 2 tab-

TITLE: The welding of teflon and other polymeric materials by the localized action of neutron irradiation

SOURCE: Trudy II Vsesoyuznogo soveshchaniya po radiatsionnoy khimii. Ed. by L. S. Polak. Moscow, Izd-vo AN SSSR, 1962,

TEXT: When ionizing radiation is used for welding polymer and other materials, its effect must be localized to avoid harmful destructive processes. The authors have developed a simple method for such localization of thermal-neutron effects: the parts to be joined are treated with compounds of boron or lithium. Boron concentration (determined photometrically) in the surface layer was $1-12 \text{ mg/cm}^2$. There is an optimum dosage for maximum strength. The welding effect cannot be due to uniform heating of the layer and is attributed to localization of the heating effect in the Card 1/2

tracks of the strongly ionizing particles produced. The authors have patented a variant of this method, in which the surfaces to be joined have a film of polystyrene containing 1% by weight of boron, an irradiation time of 2 - 3 hours (longer times reduce strength) and doses in the film and in the bulk of the joined materials of 500 - 800 and 40 - 60 megarad, respectively, the following joint strengths (kg/cm²) were obtained: teflon with teflon, polyethylene, aluminum and quartz, 90 - 110, 90 - 100. 120 - 150 and 80 respectively. tively; polyethylene with polyethylene and aluminum, 130 - 140 and 110 - 135, respectively; aluminum with polymethylmethacrylate 120 - 130. There are 2 figures and 1 table.

TITLE:

Experimental methods for radiation-chemical investigations

on a nuclear reactor

SOURCE:

Trudy II Vsesoyuznogo soveshchaniya po radiatsionnoy khimii. Ed. by L. S. Polak. Moscow, Izd-vo AN SSSR, 1962,

733-737

TEXT: Among reactions suitable for effecting in a nuclear reactor to make use of the kinetic energy of the fission fragments is the fixation of nitrogen in the gas phase to form hydrocyanic acid, hydrazine and other compounds. The authors have studied such reactions using methane, ethylene or acetylene as the carbon-containing and nitrogen and ammonia as the nitrogen-containing components. An MPT-1000 (IRT-1000) reactor of 100 ky capacity was used by the Institut atomnoy energii AN SSSR (Atomic Energy Institute of the AS USSR) to study the reactions under flow conditions. The exit gases

were analyzed after being absorbed or frozen out. The change in product yield with dosage was studied by changing the gas velocity and with composition by changing the velocity of individual components, keeping the total constant. A model of a hot cell with direct input of reagents was also studied by depositing various quantities of uranyl nitrate or boron anhydride inside the chamber. In these experiments additional cleaning of the exit gases, to remove fission fragments, was required. In some experiments the dose and yield of product were found simultaneously, thermal-neutron flux being measured with a sodium indicator. For the system $^{\rm C}_2{}^{\rm H}_4$ + NH_3 the radiation chemical yield varied from 1 to 3 molecules of HCN per 100 ev. Work on a larger scale is recommended. There are

TITLE:

Utilization of hot atom reactions for the investigation

of the intermolecular energy transfer processes

during radiolysis of organic materials

PERIODICAL: Kinetika i kataliz, v.3, no.4, 1962, 613-614

TEXT: The cyclohexene-tolan system was investigated to assess the possibility of using hot radioactive atoms to produce labelled cyclohexene excited molecules. Study of the stabilization of such molecules in different media was expected to give information on the energy transfer from the excited to solvent molecules. Excitation and labelling of cyclohexene molecules was carried out by exchanging H atoms with a hot tritium atom. It was found that the resistance of cyclohexene to decomposition increased with the concentration of tolan in the mixture. However the increasing tolan concentration had almost no effect on the specific activity of cyclohexene. Thus for the system investigated, changes in the concentration of the aromatic component did not influence the Card 1/2

Utilization of hot atom ...

stabilization process of the excited molecules of cyclohexene but decreased effectively its radiolysis. Other systems must be studied to test the general applicability of the method. There are 2 figures and 1 table.
